PROFESSIONAL SUMMARY

Full-stack software developer specializing in TypeScript and Node.js, with shipped projects spanning AI-powered developer tooling, real-time systems, and client web applications. Comfortable owning problems end to end. Done a variety of projects already from GitHub App webhook pipelines and LLM integration to hardware I/O and React/Next.js front ends. Self-taught through hands-on implementation and structured study (TripleTen Software Engineering), targeting an L1–L2 engineering role on a small team with broad ownership.

SKILLS

Languages: TypeScript, JavaScript, SQL, HTML/CSS

Frameworks & Libraries: React, Next.js, Node.js, Express, Tailwind CSS, Electron, Vite, Drizzle ORM

Platforms & Tools: Git, GitHub, GitHub Actions (CI/CD), Supabase, PostgreSQL, n8n, Vitest, ESLint, Webpack

APIs & Integration: REST APIs, Webhooks, GitHub App API, Claude (Anthropic) API / LLM integration

Concepts: AI pipeline design, real-time systems, state machines, authentication (JWT, HMAC), responsive UI

EXPERIENCE

Full-Stack Web Developer (Contract), Fences For Hire

Jun 2025 – Present

Plymouth, MA

- Designed, built, and deployed a responsive React + TypeScript marketing and lead-capture site for a local fence-installation company: six product-category pages, multi-breakpoint navigation, and a validated contact/quote form.
- Implemented the front end as a Vite-bundled SPA (wouter routing, shadcn/ui, Tailwind CSS) on an Express backend, structured so the lead store can move to PostgreSQL/Drizzle without changing the client.
- Manage production hosting, DNS, and the live domain (fencesforhire.com), plus ongoing functionality updates and SEO planning.

Independent Software Developer

Nov 2024 – Present

Remote

ShipWatch Live — *Next.js, TypeScript, Supabase, n8n, Claude API*

- Built a full-stack GitHub App that ingests real-time repository webhook events and runs AI-powered code review on each pull request through an n8n → Claude pipeline, flagging security, error-handling, and code-quality issues.
- Implemented GitHub App authentication (RS256 JWTs, scoped installation tokens) and HMAC-SHA256 webhook signature verification; added one-click auto-fix that commits corrected code back via the GitHub Contents API.
- Established the project's CI (GitHub Actions) and an automated evaluation harness (Vitest) that scores review quality against labeled cases to catch regressions across prompt and model changes.

GestureKit — *TypeScript, Node.js, Electron, React*

- Engineered a real-time global input engine with concurrent per-key state machines across 33 independently-calibrated keys, applying sub-frame, human-like timing randomization and modifier-conflict-aware execution.

- Built three interchangeable output backends — RobotJS (Windows SendInput), kernel-level Interception, and a Teensy 4.0 USB-HID microcontroller over a custom serial protocol with auto-reconnect.
- Developed a statistical per-key calibration system (sample collection, confidence scoring) and an Electron + React (Vite) dashboard with live d3/recharts visualizations; ~57k LOC with a Vitest test suite.

What To Wear (WTWR) — *React, Vite, React Router, OpenWeatherMap API*

- Built a weather-driven wardrobe app coordinating a public weather API with a personal clothing data source, with category filtering and client-side routing; deployed via GitHub Pages.

EDUCATION

TripleTen — Software Engineering Program

2024 – Present
